This article provides an in-depth review of the system analysis involved in developing a library management system (LMS), exploring key components, functionalities, and considerations that shape an effective solution.

Introduction to Library Management System (LMS) System Analysis

System analysis for a library management project involves understanding the current processes, identifying needs, defining system requirements, and designing a solution that addresses these needs efficiently. It serves as the foundation for creating a robust system that can handle various library operations, from cataloging and borrowing to reporting and user management.

The core goal of system analysis is to gather detailed insights into existing workflows, pinpoint bottlenecks or inefficiencies, and propose technological enhancements that improve overall performance. This process typically involves stakeholders such as librarians, library staff, students, and administrators to ensure that the developed system aligns with their needs.

Key Components of System Analysis in a Library Management System

1. Requirement Gathering

Requirement gathering is the initial step where the project team interacts with stakeholders to understand their expectations, daily routines, and pain points. This includes:

- Identifying user roles (librarians, members, administrators)
- Understanding current manual or semi-automated processes
