Question What is the primary function of the cell membrane in cellular physiology? The cell membrane acts as a selective barrier that regulates the entry and exit of substances, maintains cell integrity, and facilitates communication with the extracellular environment through receptor proteins. **Answer** How do neurons generate and propagate electrical signals? Neurons generate electrical signals through the movement of ions across their membranes via voltage-gated ion channels, creating action potentials that propagate along the axon to transmit information rapidly and efficiently. What role do ion channels play in neurophysiology? Ion channels are essential for controlling the flow of ions such as Na^+ , K^+ , Ca^{2+} , and Cl^- across neuronal membranes, thereby influencing excitability, signal transmission, and synaptic activity in the nervous system. How does the resting membrane potential arise in neurons? The resting membrane potential is primarily established by the differential distribution of ions across the cell membrane, maintained by the sodium-potassium pump and selective permeability of ion channels, resulting in a negative charge inside the neuron relative to the outside. What is synaptic transmission and how is it regulated? Synaptic transmission is the process by which neurons communicate via neurotransmitters released from presynaptic terminals, crossing the synaptic cleft to activate receptors on postsynaptic neurons. It is regulated by factors like neurotransmitter release, receptor sensitivity, and reuptake mechanisms. How does cellular physiology relate to neuroplasticity? Cellular physiology underpins neuroplasticity by involving changes in synaptic strength, ion channel expression, and neuronal connectivity in response to activity, learning, or injury, enabling the nervous system to adapt and reorganize. What are the key differences between gray matter and white matter in the nervous system? Gray matter primarily contains neuronal cell bodies, dendrites, and synapses, involved in processing information, while white matter consists mainly of myelinated axons that facilitate rapid signal transmission between different brain regions.
