Sample Laboratory Exercises with Detailed Descriptions

Measuring the Acceleration Due to Gravity Using a Pendulum

Objective: To determine the value of gravitational acceleration (g) using a simple pendulum.

Apparatus:

- Meter scale
- Stopwatch
- Rigid stand and string
- Bob (mass attached to the string)

Procedure:

- Measure the length (L) of the pendulum from the pivot point to the center of mass of the bob.
- Displace the pendulum by a small angle (θ).
- Release the bob without pushing to avoid additional velocity.
- Use the stopwatch to measure the time (T) for 20 oscillations.
- Calculate the period ($T_0 = T/20$).
- Use the formula $(g = \frac{4\pi^2 L}{T_0^2})$ to find g .

Analysis:

Compare the experimentally obtained value of g with the standard value (9.81 m/s^2). Discuss potential sources of error such as timing inaccuracies or amplitude effects.

Determining Specific Heat Capacity of a Metal

Objective: To find the specific heat capacity (c) of a metal using calorimetry.

Apparatus:

- Calorimeter
- Metal sample (e.g., copper or aluminum)
- Thermometer
- Electric heater or hot water bath
- Balance for mass measurement

Procedure:

- Measure the mass (m) of the metal sample.
- Heat the metal to a known temperature (T_{hot}) using an electric heater or hot water bath.
- Record the initial temperature of hot water (T_{hot}) and the calorimeter's temperature (T_{initial}).
- Immerse the hot metal in the calorimeter containing a known mass of water at room temperature (T_{initial}).
- Stir gently and record the final equilibrium temperature (T_{final}).
- Calculate c using the heat exchange equation:

$$(m_{\text{metal}} c_{\text{metal}} (T_{\text{hot}} - T_{\text{final}}) = m_{\text{water}} c_{\text{water}} (T_{\text{final}} - T_{\text{initial}}))$$

Analysis:

Calculate the specific heat capacity and compare it with literature values. Discuss experimental errors such as heat loss to surroundings.
